Further Contribution to the Flora of Kutch in Gujrat State

S. K. Jain and U. R. Deshpande

Botanical Survey of India, Western Circle, Poona

Abstract

The flora of Kutch has many species in common with Sind and Gujrat. The district has large sandy and saline marshy tracts which are colonized by xerophytic and halophytic species. A study of the recent collections from this area in Poona herbarium revealed that the following species have not been reported from the area so far and are, therefore, new plant records for the area:

The district of Kutch in Gujrat State is situated approximately between the latitude 22°-30° to 24°-00' N and longitude 68°-25' to 71°-00' E. The area is surrounded on the west by the Arabian sea, on the north by the Great Rann of Kutch, on the south by the Gulf of Kutch and on the east by the Little Rann of Kutch. It is thus approached by either water or swampy marshes or by vast low-lying saline and sandy tracts of the Ranns. Kutch is rather a plain country with few low hillocks here and there. The highest hill is in northern district, the 'Kala Dungar' with an altitude of about 450 m. Dinhodar hill situated towards the north-west of the district is slightly lower. The soil of Kutch is mostly sandy or rocky and all low-lying country has saline soil. The flora of these habitats, therefore, has xerophytic characters. Blatter (1908) has described in detail the xerophytic adaptations of some more common plants.

The area is botanically underexplored. Palm (1880) and Blatter (1908) gave lists of plants of this district. Inzari Thakar (1926) wrote in Gujrat a detailed account of the economically important plants of Kutch. Later Kapadia (1934 a & b) wrote short botanical papers on the area.

In order to explore the plant-wealth of the area, several botanical tours were undertaken in different seasons during the years 1957-60. A complete flora based on 417 species has been prepared (Pun, Jain & Deshpande, 1959) and this paper describes some species not mentioned therein. Other additions were made by Jain and Kapadia (1960), Deshpande (1960) and Jain (1961).

Kutch is very significant phytogeographically as it is the meeting ground for the arid African and Arabian elements of flora with that of India.

Blatter (1908) gave a list of 745 indigenous species belonging to 74 natural orders. Inzari Thakar (1926) described 568 species belonging to 71 natural orders; he has included some exotic also. Kapadia (1954) added about a dozen grass species to the flora.

The flora of Kutch has resemblance with that of Sind and Gujrat, the former affinity is more evident. Blatter also pointed out that out of his 345 species about 200 were common with Sind. It is interesting to observe that more and more plants reported from Sind are now being found in Kutch, and many of them do not occur eastwards of Kutch. The thorny scrub jumble forms dominant vegetation of Kutch. Several degraded stages of scrub vegetation are seen in overgrazed areas. In protected and monsoon situations such as valleys of the hills at Dinhodar, Kala-Dungar and Makrihol the vegetation tends to develop into good deciduous forests, which show resemblance to the typical dry deciduous forests of the Deccan Trap, with species such as Sorbus densiflora Roxb., Lawsonia inermis Linn. Merr., Moringa oleifera Lam., Pterocarpus indicus Roxb., Salmalia malabarica Schott et Endl., Coriaria dichotoma Forsk., C. vogelii Rottl. & Schult., Moringa oleifera Lam., Lawsonia inermis L. ex. (Pt. 1).

The saline tracts and the riverain areas have sparse scrub forests of Salvadora persica L., S. oleoides Decne., Tamarix species and Calotropis procera R. Br.

Rocksy habitats with poor shallow soil and waste lands are colonized by abundant growth of Cistanche species of which four viz. C. articulata L., C. obtusa Roxb., C. holosericea Friesch, and C. angustifolia Vahl are conspicuously seen in yellow flowers in the summer season.
Dense colonies of *Eichhornia crassipes* Roxb. occur on freshly exposed hard clays, soils along railway lines.

Mangroves occur all along the coast, mostly poor and disturbed. *Aristea adusta* Burens is the commonest mangrove plant, and grows to tree habit up to 4 to 5 meters high (Ph. 3). The sandy banks along sea-creeks have dense growth of *Asparagus densus* Beker, *Cordia varia* Hamb., *Aeluropus hegopenus* (L.) Trin. ex. Thuawane and several grasses.

The low-lying tracts along sea-creeks and backwaters are covered by a number of halophytes such as *Succisa fruticosa* Forsk., *Aeluropus baeteticus* (L.) Trin. ex. Thuawane. *Urochloa pseudina* C. E. Hubb., *Juncus maritimus* Lam. and *Cenchrus cressica* L. (Ph. 4).

An examination of our material and available published works, such as Hooker (1827-37), Cooke (1908), Blatter (1908), Thakar (1926) and Kapadia (1956) revealed that a number of plants have not been reported from Kutch by earlier workers.

The following pages briefly describe 23 such species. Short notes on their general distribution in India have been added. Detailed descriptions have been avoided as they are available in published florae. References to those works have been given. Some of the plants described below have very restricted distribution in India and their occurrence in Kutch is of significance for their distribution patterns.

An undershrub; leaves lanceolate, acute or acuminate; flowers in short cymes; capsule elongate, cylindric with triad beak.

Khavda, *Jain 46872*; Suratnagar (Surat). *Jain 1842*.

The plant occurs in North-Western India, Gangetic plain, Bihar, Orissa and Madras. It is not reported from Kutch, Suratnagar, North Gujarat, Bombay and Kerala. Its earlier report from Western India is only from Sind. Its report from Kutch and Suratnagar fills a gap in its general distribution in India.

An undershrub; leaves 1.25-3.5 cm. long, downy; flowers pale yellow, carpels 7-8, nearly glabrous. *Radhamata, Jain 46844*.

The plant is common in the drier parts of Western India, but is not reported from Kutch so far.

An unarmed tree; leaves elliptic, glabrous on both sides, fruit globose about 1 cm. diam.

*Radhamata, Jain 46800*.

This plant occurs in several parts of India but is not reported from Kutch so far. The plant differs from other species of the genus in being unarmed.

A shrub or undershrub; leaves 10-16, oblong-lanceolate, acute; racemes axillary, many-flowered, flowers yellow, legume 3-5.

Anjar, *Jain 46888*; growing in waste places in outskirts of the old town demolished by earthquake.

This plant is a native of tropical Africa; it also occurs in Arabia. Doutrell and Gibson (1846) remarked that the plant was first grown in India at Hivre garden near Poona from seed obtained from Aden. It is reported to be cultivated on a limited scale in Madras also. The plant seems to have its wild in Kutch of recent.

A prostrate succulent herb; leaves flasky; capsule 8-12 seeded.

Nakhtrani road, *Jain 11864*.

This plant occurs in drier parts of North-Western India, it has not so far been reported from Kutch and other northern parts of Gujarat.

An annual herb, 15-40 cm. high; branches scabrid, leaves whorled; flowers in terminal cymes; corolla tube long; capsule scabrid.

Khavda, *Jain 46865*.

The plant grows in North-Western, Central and parts of Southern India. It has not been reported from Gujarat and Kutch so far.

An erect herb, flowers yellow in heads, pales of the receptacle boat-shaped, enclosing the curved, gibus ribbed achenes.

Dhulikhel, *Jain 46993*.

Good (1923) included the genus *Schlerocarpus* under genera restricted to America and continental Africa only. *Schlerocarpus urucurana* is not reported from Aden or Arabia. In India it occurs at Western Himalayas, Upper Gangetic Plain, Madras and parts of Bombay State. It is not reported from Western Rajasthan, Kutch or Sindh.

A small plant with woody base, leaves hairy; flowers 1-ranked in scapose cymes; calyx densely hairy.

Mundri-Mandvi, *Jain 11760*. 
Hooker (loc. cit.) & Cooke (1908) reported this plant, only from Sind. M. Macadam (1890) mentioned it in his list of Jodhpur plants. There is no report so far of its occurrence in Kutch or elsewhere in India.

(Convolvulaceae)

A herb; leaves sessile, linear, acute; sepals glabrous.

Rbndhar, Jain 46936.

**E. nana var.** The present variety differs from it in its sepals being glabrous outside. The variety is reported only from Saurashtra and nowhere in present boundaries of India.

Stocks (loc. cit. 172) described this plant as a distinct species. Clarke (loc. cit.) reduced it to a variety of *E. nana* with which it resembles very closely.

(Canavaliaeanae)

A slender, hispate, prostrate herb; leaves suberect form; flowers white.

Dhinkhar, Jain 46905.

Hooker (loc. cit.) reported this plant only from hills of South India. It is not reported from North-Western India such as Punjab, Rajasthan, Kutch, Saurashtra or from Bombay.

(Canavaliaeanae)

An annual prostrate hispate herb, leaves oblong hastate or deltoid hastate, flowers in few-flowered cymes.

Kuvaia, Jain 46858.

The plant has been reported from several drier parts of Western India, but it is not so far recorded from Kutch.

(Schizandraeceae)

A herb, leaves thick; flowers axillary lilac, capsule 6-8 mm, globose.

Gandhinagar, Jain 61401, growing on loose rocky soil along railway line.

The plant has not been reported from Kutch so far. It occurs in drier parts of Saurashtra and Rajasthian.

(Schizandraeceae)

A small prostrate herb with fleshy leaves; flowers axillary, 1-3-flowered.

Khunana Talao, Jain 61480, growing among stones on the embankment of tank.

---

This plant occurs in several places in Deccan Peninsula. It has not been reported so far from Kutch, Saurashtra or any other parts of Gujarat.

(Euphorbiaceae)

A slender glabrous annual herb, flowers axillary on short pedicels.

Dhinkhar, Jain 46938.

The plant occurs in several parts of India; it has not so far been recorded from Western India, such as Rajasthan, Kutch, Saurashtra and Bombay.

(Gramineae)

A grass with narrow linear acuminate leaves and 2-6 erect spikes.

Bhuj, Mahajan 11450.

This grass occurs in the Gangetic plains and southwards to the Peninsula. It has not so far been reported from Rajasthan and Kutch.

(Gramineae)

Dhinkhar, Jain 46972.

Hooker (loc. cit.) and Blatter and Carn (1936) reported this grass only from Saurashtra and nowhere else in India. No species of the genus *Chrysopogon* is reported from Kutch so far.

**Crypsis schoenoides** (L.) Lam. Eecke, 1: 166.

An annual prostrate grass; leaves narrowly lanceolate; acuminate; inflorescence a spikelike ovate, oblong compressed panicule sessile on the dilated sheath of the uppermost leaf.

Patiala Talao, Part 31533.

This grass occurs in Punjab, Western Himalayas and Saurashtra and has not been reported so far from Rajasthan, Kutch and Saurashtra.

**Disturia peninsulana** (Hochst.) Chievo, Recueil. Scent. Miss. Stefanini Paolo, 1: 183.

(Gramineae)

A tufted leafy grass with spreading characteristically hairy spikes (Ph. 51).

Dhinkhar, Jain 46960.

The grass occurs in drier parts of North-Western India and in Upper Gangetic Plain. It has not been reported from Saurashtra, North Gujarat & Kutch.

(Gramineae)

Chittoj, Jain 46772; Anjar, Jain 46797A; Bhujand, Jain 46818.

The grass is common almost all over India; but it had not been reported earlier from Kutch.

A tufted stout or slender grass, spikelets variable in size, silky hairy.

Dhinochar, Jain 46942.

The grass is generally distributed in Upper Gangetic Plain, Madhya Pradesh and Deccan. It is not reported from Saurashtra, North Gujarat, Kutch & Sind so far.

A perennial grass, 60-90 cm. tall, racemes solitary.

Dhinochar, Jain 46971.

This grass is common in several parts of India, but is not reported from Kutch so far.

A slender annual grass.

Dhinochar, Jain 46812, 46914; Anjar, Jain 46785.

This grass is recorded from several places in North-Western India. It has not been reported from North Gujarat, Western Rajasthan and Kutch. It has been found to be common in several parts of Kutch.

A slender grass with solitary rather flat erect spikes.

Anjar, Jain 46693.

The grass is common in Western India but has not so far been recorded from Kutch.

The following is an additional list of plants which were not reported by Blatter, Thakar & Karadaria from Kutch. These have recently been collected and reported from there, Jain, 1960; Jain and Kanodia, 1960; Deshpande, 1960.

1. Tamarix articulata Vahl.
2. Trigonella occulta Del.
3. Astragalus proximus Sieb.
4. Xanthium strumarium L.
5. Heliotropium rariflorum Stocks.
6. Tribulus triangularis Roth.
7. Premna rotundata Schau.
8. Euphorbia dracontoides Lam.
10. Juncus maritimus Lam.
11. Ephedra foliata Boiss.

We are grateful to Dr. J. C. Sen Gupta and Dr. G. S. Puri for their kind advice and help in preparation of this paper. Our thanks are due to the officers of the Forest Department of Kutch who gave facilities in field work.
